Houston, we have a *problem*

Leaked secrets could lead to data breaches

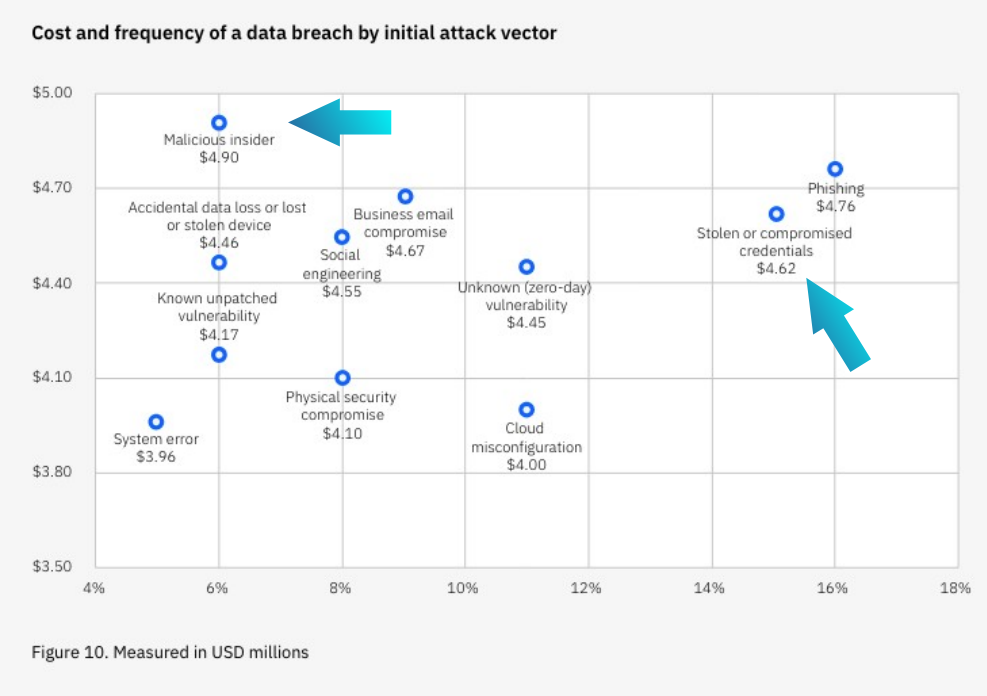

Figure 10. Measured in USD millions

- The usage of **stolen or compromised credentials** is the second common initial vector, by frequency, for a data breach.
  - With a frequency of 15% and a cost of 4.62M USD.
- The **malicious insider** is the highest initial vector, in terms of cost, for a data breach.
  - With a frequency of 6% and a cost of 4.90M USD.
- *"Assume breach"*

"Cost of a Data Breach Report 2023", Ponemon Institute

Secrets leaked in repositories are a concern

Secrets encompass confidential information, such as: passwords, encryption keys, API tokens, digital certificates, etc.

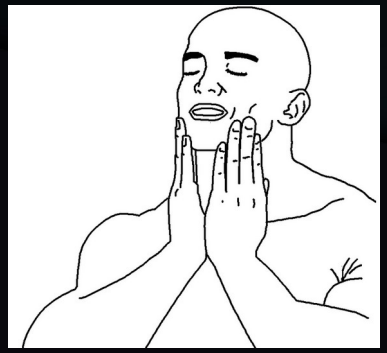
Secrets are pivotal for authenticating and authorizing access to secured resources and systems.

Detection is important...

Detection lets you know when there is a problem

- Secrets detection is part of *Static Application Security Testing* (*SAST*).
- There are several tools, commercial or not, able to perform this kind of checks:
  - *gitleaks* - https://github.com/gitleaks/gitleaks
  - *trufflehog* - https://github.com/trufflesecurity/trufflehog
  - *ggshield* - https://github.com/GitGuardian/ggshield
  - *detect-secrets* - https://github.com/Yelp/detect-secrets
  - *git-secrets* - https://github.com/awslabs/git-secrets
  - *Semgrep Secrets* - https://semgrep.dev/products/semgrep-secrets
  - ...
- In this talk Gitleaks will be used, but the **concepts are the same**!

Detection has its own limitations



Sometimes detection is easier…

```
aws_secret="AKIAIMNOJVGFDXXXE4OA"
```

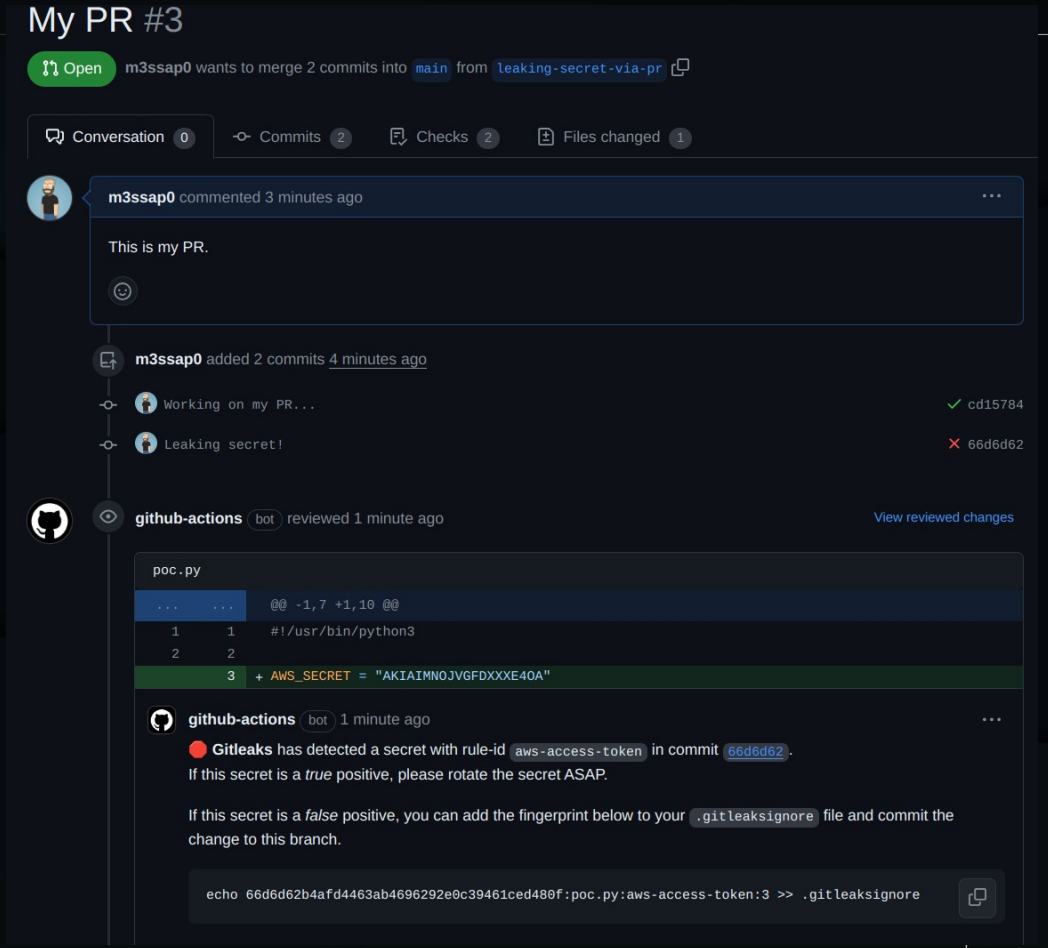
Sometimes detection is harder…

```
password_field_label="password-fld-lbl-1"

my_password="$up3rP4ssw0rd!"
```

Centralize detection in CI/CD to spot problems

- It’s unrealistic to scale Application Security activities without leveraging on automation.
- Look for plugins for your CI/CD ecosystem.
  - Gitleaks has an official GitHub Action.



https://github.com/gitleaks/gitleaks-action

Example of a GitHub workflow

```yaml
name: gitleaks
on: [pull_request, push, workflow_dispatch]
permissions:
  # Allow access to commit list
  contents: read
  # Allow access to adding comments
  discussions: write
  pull-requests: write
jobs:
  scan:
    name: gitleaks
    runs-on: ubuntu-latest
    steps:
      - uses: actions/checkout@v3
        with:
          fetch-depth: 0
      - uses: gitleaks/gitleaks-action@v2
        env:
          GITHUB_TOKEN: ${{ secrets.GITHUB_TOKEN }}
```

https://github.com/gitleaks/gitleaks-action

Customize the solution based on your needs

- ~166 standard rules provided by Gitleaks.
- Rules are based on regexes.
- You can create your custom rules via TOML files and use them with the `-c` param or the `GITLEAKS_CONFIG` environment variable of the GHA.

```
# Your custom Gitleaks configuration file.

title = "Your custom Gitleaks rules"

# Extending default rules.

[extend]

useDefault = true

[[rules]]

# Put your custom rules here.
```

https://github.com/gitleaks/gitleaks/blob/master/config/gitleaks.toml

Example of a Gitleaks rule

```
[[rules]]

id = "aws-access-token"

description = "Identified a pattern that may indicate AWS
credentials, risking unauthorized cloud resource access and data
breaches on AWS platforms."

regex = '''(?:A3T[A-Z0-9]|AKIA|ASIA|ABIA|ACCA)[A-Z0-9]{16}'''

keywords = [

    "akia","asia","abia","acca",

]
```

https://github.com/gitleaks/gitleaks/blob/79cac73f7267f4a48f4bc73db11e105a6098a836/config/gitleaks.toml#L124

… but *Prevention* is better!

Pre-commit hooks can prevent leaks

- A leaked secret – even if detected – is still a leaked secret.
- *Pre-commit* hooks can be configured in your workstation to perform scan locally, blocking dangerous commits and preventing leaks from happening.

- Install Gitleaks (it requires Go).
- Create a folder to store global hooks, for example:
  - `/home/<your_user>/gitconfig/hooks`
- In that folder, create a file named **exactly**:
  - `pre-commit`
- In that file, write the script to perform the check (Python example in the next slide).
- Make the file executable.
- Edit global git config file, usually `.gitconfig` in your home, to add the following lines.

```
[core]
    hooksPath = /home/<your_user>/gitconfig/hooks
[hooks]
    gitleaks = true
```

Example of *pre-commit* hook in Python

```
def gitleaksEnabled():
    out = subprocess.getoutput('git config --bool hooks.gitleaks')
    if out == "false":
        return False
    return True

if gitleaksEnabled():
    exitCode = os.WEXITSTATUS(os.system('gitleaks protect -v --staged --redact'))
    if exitCode == 1:
        print('Warning: gitleaks has detected sensitive information in your changes.')
        sys.exit(1)
else:
    print('gitleaks precommit disabled (enable with `git config hooks.gitleaks true`)')
```

https://github.com/gitleaks/gitleaks/blob/master/scripts/pre-commit.py

Commit blocked on the development workstation

```
$ git diff
diff --git a/poc.py b/poc.py
index 3c2a64c..ca76df5 100755
--- a/poc.py
+++ b/poc.py
@@ -1,5 +1,7 @@
 #!/usr/bin/python3

+AWS_SECRET = "AKIAIMNOJVGFDXXXE4OA"
+
 def main():
     print("This is a PoC for Gitleaks.")

$ git commit -am "Trying to leak secret!"

    gitleaks

Finding:     AWS_SECRET = "REDACTED
Secret:      REDACTED
RuleID:      aws-access-token
Entropy:     3.646439
File:        poc.py
Line:        3
Fingerprint: poc.py:aws-access-token:3

12:25PM INF 1 commits scanned.
12:25PM INF scan completed in 2.59ms
12:25PM WRN leaks found: 1
Warning: gitleaks has detected sensitive information in your changes.
To disable the gitleaks precommit hook run the following command:

    git config hooks.gitleaks false
```

Paved roads, the cultural change

Make the wrong road also the hard one

- *Paved roads* aka *secure defaults*, *golden paths*, ...
- Give to software engineers solutions, not just problems to solve.
- Invest in the adoption of secrets management tools
  - *HashiCorp Vault*
  - *Google Cloud Secret Manager*
  - *AWS Secrets Manager*
  - *Azure Key Vault*
  - ...
- Software engineers will have a concrete solution to their problem and you will effectively manage the secrets ecosystem.

Let’s wrap it up!

A problem, but different strategies to solve it

- Secrets leaked in source code can be used by malicious actors to compromise other platforms in your ecosystem.
- Tools exist to perform checks automatically.
  - Centralize the scan to scale.
  - Customize the solution with your own rules.
  - Prevent at development workstations.
- Invest in the culture and provide solutions via usable secure defaults.

Thank you!
